

1) Consider a disk with 32 platters each with 2 recording surfaces. There are 128 tracks per surface and 32 sectors per track. Each sector has equal capacity of 1KB

Calculate

1. Number of surfaces in disk:
2. Number of tracks on disk:
3. Number of sectors in disk:
4. Number of bytes on disk:
5. Number of bits for disk addressing:

2) A hard disk has 16 sectors per track, 4 platters each with 2 recording surfaces and 32 cylinders. The address of a sector is given as a triple $\langle c, h, s \rangle$, where c is the cylinder number, h is the surface number and s is the sector number. Thus, the 0th sector is addressed as $\langle 0, 0, 0 \rangle$, the 1st sector as $\langle 0, 0, 1 \rangle$, and so on.

The address $\langle 12, 6, 12 \rangle$ corresponds to sector number?

3) A hard disk has 16 sectors per track, 4 platters each with 2 recording surfaces and 32 cylinders. The address of a sector is given as a triple $\langle c, h, s \rangle$, where c is the cylinder number, h is the surface number and s is the sector number. Thus, the 0th sector is addressed as $\langle 0, 0, 0 \rangle$, the 1st sector as $\langle 0, 0, 1 \rangle$, and so on.

Find the address of 867th Sector..

4) Consider a disk with 12 platters, 2 surfaces per platter, 3K tracks per surface, 6K sectors per track and 2048 Bytes per sector. Disk rotates with 3000rpm. Seek time is 6ms. Find disk access time?

5) A disk has each track with 1k sectors each with 4KB capacity and disk has 6000RPM. The transfer rate of the disk is?
